Tetra Iso-Extract

❖ Overview

• **Tetra Iso-Extract (Tetra)** is a pure, aqueous solution of the potassium salts of tetrahydro iso-alpha acids derived exclusively from CO$_2$ extract.

• **Tetra** greatly enhances beer foam when used as a post-fermentation replacement for a portion of conventional bittering products.

• **Tetra** provides protection against lightstruck flavor when used as the sole source for bitterness or in combination with other light stable hop products.

❖ Specifications

• **Description:** amber, aqueous solution of the potassium salts of tetrahydro iso-alpha acids
• **Concentration:** $9.0 \pm 0.5$ % (w/w) of tetrahydro iso-alpha acids by HPLC or $10.0 \pm 0.5$ % (w/w) by UV spectrophotometric analysis
• **Iso-alpha acids:** below detection limit
• **Alpha acids:** below detection limit
• **pH:** $9.5 \pm 1.0$
• **Viscosity:** $2 – 6$ mPas at $20$ °C ($68$ °F)
• **Density:** $1.017 \pm 0.005$ g/ml at $20$ °C ($68$ °F)

Questions

- Quality
  All Hopsteiner® products are processed in facilities which fulfill internationally recognized quality standards.

- Packaging
  Tetra is normally packaged in 20 kg pails. 10 kg jugs are also available.

- Product Use
  Tetra is typically used as a post-fermentation addition and prior to the final step in filtration.

- Dosage
  Dosage is based on the product concentration, an estimated or known utilization and the desired intensity of bitterness in the beer. The fact that the perceived bitterness of Tetra is about 1.0 to 1.3 times the bitterness of iso-alpha acids derived from conventional hop products must be taken into consideration. The correct dosage of Tetra must be determined through trials at the brewery.

- Addition
  We recommend adding Tetra at full strength (undiluted) into the center of the beer stream for at least 70 % of the total volume being transferred. An accurate, high pressure dosing pump is required to add the product into the beer stream at a point where vigorous mixing is assured. Tetra can be added at ambient temperatures.
If dilution is necessary, always add Tetra to demineralized water and adjust the pH to 10 – 11 using potassium hydroxide (KOH).
If containers are used over several days, it is recommended that the headspace be flushed with nitrogen (CO₂ is not suitable).

**Cleaning Recommendation**

Tetra should not be left in dosing lines at low temperatures. Lines and dosing pumps should be flushed with warm, slightly alkaline, demineralized water or ethanol for purposes of cleaning.

**For Light Stable Beer**

For maximum protection against lightstruck flavor, it is essential that no other sources of non-reduced iso-alpha acids are inadvertently introduced into the wort or beer. Therefore, the following must be carefully implemented:
- exclusive use of light stable hop products throughout the entire process
- avoid contamination through equipment surfaces previously in contact with regular iso-alpha acids
- never pitch wort with yeast that has been in contact with regular alpha and iso-alpha acids

**Storage**

Tetra should be stored in sealed containers at 5 – 15 °C (41 – 59 °F). Avoid exposure to sunlight. Opened containers should be used within a few days.

**Best Before Date**

Tetra is stable two years from the date it was produced / packaged if stored under the recommended conditions.

**Safety**

Tetra is a slightly alkaline, intensely bitter product and may be safely handled using routine precautions to avoid contact with skin and, in particular, the eyes. Any product coming into contact with the skin should be washed off immediately with soap and water or an appropriate hand cleanser. If Tetra gets into the eyes, flush with copious amounts of water until clear and seek medical attention.
For full safety information, please refer to the relevant Hopsteiner® safety data sheet.

**Analytical Methods**

**Concentration of Bitter Substances**

The concentration of tetrahydro iso-alpha acids can be measured using the following methods:
- HPLC according to Analytica-EBC 7.9 with the current ICS standards
- UV spectrophotometric analysis

**Concentrations of Reduced Iso-Alpha Acids in Beer**

The concentration of reduced iso-alpha acids in beer can be measured by HPLC according to Analytica-EBC 9.47.

Note:
It is possible that analysis results for the corresponding value for bitterness must be adjusted. The factor used in this analysis will result in lower values if reduced hop products were used as the exclusive source for bitterness or in higher amounts.
• **Foam Stability and Cling Test**
  Foam stability can be measured using the following methods listed in MEBAK, ASBC or Analytica-EBC:
  - NIBEM-T Meter
  - NIBEM Cling
  - Steinfurth Foam Stability Tester
  - Ross & Clark
  - Pour Test

❖ **Technical Support**

We are pleased to offer assistance and advice on the full range of Hopsteiner® products:

  - copies of all relevant analytical procedures
  - Safety Data Sheets (SDS)
  - assistance with pilot or full-scale brewing trials
  - special analytical services
