

# Report on Weather and Hop Growing Conditions

Report Period: September 2018 - April 2019

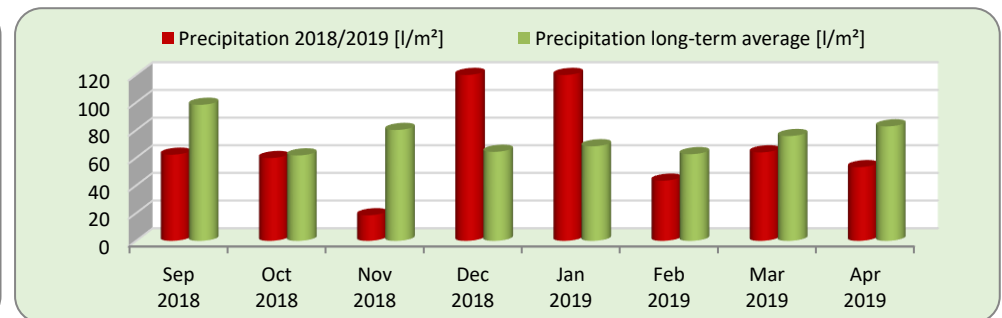

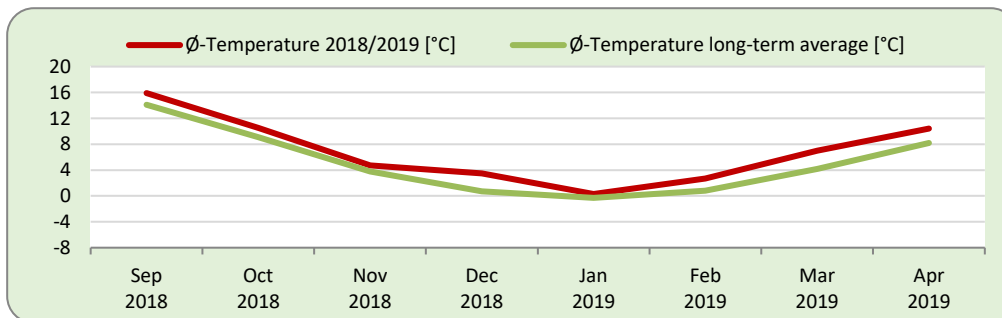

## HALLERTAU

## ELBE SAALE

## TETTANG

### Comments:

A very dry and sunny autumn with above-average temperatures enabled the hop growers to carry out the work from September to December without time pressure. It was in December that precipitation began to increase. From January onwards, precipitation turned into snow as temperatures dropped. February began with plenty of snow, and by the second decade it had melted away again with constantly rising temperatures. In general, the trend continued with significantly above-average temperatures in spring and it was also very dry. However, the conditions for work were ideal.
